# Proportion

---

# The page is a golden rectangle

---

The page measures 161.8 mm by 100 mm, i.e., a ratio of 1.618, and the margins are 34 pt and 21 pt, two consecutive Fibonacci numbers: since their ratio is again  $\varphi$ , the block of text is a golden rectangle as well.

# Golden columns

---

## Major

The first column takes  $\varphi^{-1} \approx 61.8\%$  of the width, the gutter is 21 pt.

## Minor

The second takes  $\varphi^{-2} \approx 38.2\%$ .

## Minor first

[minor] swaps them.

## Major second

The two parts always add up to the text width.

# A modular scale of type

Every size is the base times a power of the ratio, here  $\varphi$ ; half steps give the small print.

| step | size (pt) | used for                       |
|------|-----------|--------------------------------|
| 2    | 28.67     | title, section pages, standout |
| 1    | 17.72     | frame titles, subtitles        |
| 0    | 10.95     | text, block titles             |
| -1/2 | 8.61      | foot line, captions, footnotes |

The half step  $\sqrt{\varphi}$  is the ratio of the sides of the Kepler triangle; spacings are Fibonacci numbers 3, 5, 8, 13, 21 pt.

# Color

---

# One color, and the others follow

base  
#7A52C0

complement  
#C09D52

split  
#C08252

triad  
#C06652

analog  
#B152C0

The accents are rotations of the hue of the primary on the painter's wheel (red, yellow, blue), so violet calls for gold. Before they are used for text, they are moved in lightness until they reach a contrast of 4.5:1.

| on the canvas | ratio |
|---------------|-------|
| ink           | 17.21 |
| primary       | 5.38  |
| accent        | 4.52  |
| muted         | 4.91  |

# Golden tints

Tints dilute a color by  $\varphi^{-k}$  towards the canvas.

03

# Composition

---

# Thirds and golden sections

The dashed lines divide the page in thirds, the solid ones at the golden section; guides=both draws them on every frame while one composes the slides.

**Less, but better.**

04

# Elements

---

# Lists and blocks

---

- squares whose side
    - shrinks by  $\varphi$ 
      - at every level
  - **alerts** take the accent
1. numbers
  2. in the primary

## Block

Golden tints.

## Alert

The accent.

## Example

The second accent.

# Mathematics, code and plots

$$\varphi = \frac{1 + \sqrt{5}}{2}, \quad F_n = \text{round}\left(\frac{\varphi^n}{\sqrt{5}}\right)$$

```
def fib(n):  
    # Binet's formula  
    phi = (1 + 5 ** 0.5) / 2  
    return round(phi ** n / 5 ** 0.5)
```

**Thank you**

# Backup

---
